PROFESSIONAL SUMMARY

Product leader with 13+ years taking digital products from concept to scale across fintech, edtech, and government platforms in Egypt, Saudi Arabia, the UAE, and Kuwait. I own products end to end, from discovery and strategy through delivery with engineering, and I turn user and market research into roadmaps teams can build against. I have scaled a consumer wallet 20x, led the redesign of an insurance platform rated 4.7 stars by 157,000+ users, and shipped AI into live products, including my own SaaS. A Computer Science degree and a Marketing MBA let me work across the technical and commercial sides of the business.

SELECTED IMPACT

- **Tameeni:** Led the redesign of Saudi Arabia's leading motor-insurance app; the version live today, rated 4.7 stars by 157,000+ users with 1M+ downloads, is the one I shipped.
- **AevaPay:** Owned product for a live fintech wallet, scaling it from 5K to 100K+ users and growing transaction volume 35%; the platform now operates in Oman under the same model.
- **Nagwa Classes:** Launched major components of Nagwa's live online-learning product, now past 1M+ downloads.
- **Aanaab:** As Scrum Master, delivered dozens of successful sprints for this Saudi teacher-development platform, now serving 200,000+ registered teachers and still live today.
- **Super CV:** Built and run a live AI SaaS I designed, engineered, and shipped solo, with AI-tailored CVs, an application tracker, and mock-interview prep.

EXPERIENCE

Lead Product Manager, GeoTech — Egypt / Riyadh

January 2026 – Present

GeoTech builds multi-tenant GIS and spatial-intelligence platforms for businesses and government entities in Saudi Arabia. The company grew up on services and government projects; the brief since January: turn that capability into a product business. Fix and rebrand the product portfolio, group the products into one coherent suite, and open B2B as a market alongside B2G.

- Restructured and rebranded the product line into a unified suite, repositioning the company from a services house toward sellable products with both B2B and B2G offerings.
- Own the end-to-end product roadmap and drive new GIS solutions from concept to launch, resulting in multi-million dollar agreements with municipalities and government institutions.
- Lead teams across product, design, development, and research, and sit on the executive strategy team.
- Drove tool-stack rationalization across the company: migrated the full operation from ClickUp to GitHub at zero license cost, eliminating roughly \$11,000 to \$15,000 a year in software spend, with operations running better than before, not worse.
- Re-engineered the design function around AI: moved production workflows onto Claude, restructured the design team, and recalibrated workload and utilization to the new operating model.
- Embedded AI across how we build: more than 70% of end-to-end design, documentation, and development is now automated.
- Lead the marketing research and UX research that feed positioning, pricing, and product decisions.
- Set product vision with design and research, and own delivery with engineering by turning technical constraints into scope decisions the business can act on.
- Carry the commercial front line when needed: compliance responses, RFP submissions, and the marketing content behind them, from presentations to brochures.
- Invest in the team pipeline as well: launched the internship program and the referral program that bring new talent in.

Outcomes: Unified product suite in place of a scattered portfolio, multi-million dollar agreements with municipalities and government institutions, and more than 70% of end-to-end design, documentation, and development automated.

Senior Product Manager, GeoTech — Egypt / Riyadh

August 2024 – January 2026

When I joined GeoTech, spatial analysis lived with GIS specialists, and every planning decision waited in their queue. The brief: change that.

- Built the flagship geospatial decision-support system from zero and shipped it into production.
- Drove a privacy-first data architecture with engineering: a data lake for analytics split from PostGIS for live map operations, with RAG feeding the LLM only schema from a vector database.

- Mentored 4 product managers and set the discovery and prioritization processes the team still runs on.

Outcomes: A decision-support system now used inside several government entities, spatial analysis in the hands of non-technical staff, and AI that generates spatial queries without ever touching client data.

Research Manager, Rasan FinTech (Tameeni) — Dubai / Riyadh

October 2023 – June 2024

Rasan is the Saudi fintech group behind Tameeni, the Kingdom's leading insurance aggregator, used by more than 10 million people every year. The product had massive scale; the question was whether it still matched what users needed. The brief: make the company decide with evidence, not opinions.

- Founded and ran the research practice: focus groups, user interviews, usability testing, and behavioral analysis with GA4 and Hotjar.
- Ran the Comprehensive Motor investigation end to end: root-cause analysis on SAMA, Najm, and PwC market data, then eight Ipsos focus groups across Riyadh and Jeddah, from questionnaire design to a 50-page findings report.
- Led the design and research team through the full revamp of Tameeni, from insight to shipped redesign.
- Drove design-thinking adoption across product and design through workshops, training, and hands-on coaching.

Outcomes: The revamped Tameeni is the version live in the stores today, rated 4.7 stars by 157,000+ users, and research became part of how the company decides.

Product Development Manager, Rasan FinTech — Dubai / Riyadh

May 2023 – October 2023

Hired to grow the portfolio beyond the flagship, in a SAMA-regulated market where every move has a compliance dimension.

- Pioneered new insurance products, expanding and diversifying the portfolio.
- Identified and shut down an underperforming product before it burned more budget, and moved the resources to better bets.
- Built partnerships and technical integrations with Alinma Bank, ANB, and Sayarah.com, including pitching a bank-embedded auto-lease marketplace to ANB.
- Founded the UX and market research department from zero, authoring its charter, methodology, and team design; it validated every new line before we built it.

Outcomes: A broader portfolio contributing a 10% increase in revenue, budget redirected from a product that was not earning it, and a research function the company kept.

Product Lead, AevaPay — Egypt

February 2022 – May 2023

AevaPay is an Egyptian fintech that built a wallet and merchant platform for the people and small shops the banks ignore, and the platform now operates in Oman under the same model. The app had launched weeks before I joined, and I was the only senior product person: strategy, roadmap, and delivery across wallet, card acceptance, POS, and bill payments. At 5,000 users nothing was a single problem. Almost nobody knew the product existed, most who tried it did not come back, and nothing carried what users hit in the app back into the roadmap.

- Owned the product agenda end to end, what got built, what got cut, and in what order, with no product peer or manager above me in the function.
- Grew the wallet by working every constraint at once rather than betting on one fix: built the marketing function from scratch for awareness, introduced non-bank KYC under Central Bank of Egypt rules so unbanked users could finish signing up, ran a full app redesign, closed the service gaps in bill payments and telecom top-ups, and put a feedback and analytics loop on Amplitude that fed the roadmap every week.
- Expanded payment options through integrations with ValU, Fawry, CashCall, and Momken, and designed a sub-aggregator incentive model that passed roughly EGP 1M a day in credits through to retailers to drive usage cycles.
- Led the technical revamp from MVP to a robust, scalable infrastructure, cutting technical debt while the product kept running.
- Established the product KPIs, adoption, transaction volume, and retention, that the company still runs on.

Outcomes: User base grew from 5K to 100K+ in 12 months (20x), transaction volume rose 35%, and the platform proved sound enough that it now operates in Oman under the same model.

Product Manager, Nagwa Technologies — Egypt

April 2021 – February 2022

Nagwa is an edtech company whose platforms serve more than 2 million learners a year. It was strong in B2B content; the bet I was hired for was consumer.

- Launched the company's first two B2C apps, Nagwa Exams and Nagwa Readers, opening a direct revenue stream to offset B2B volatility.
- Designed the freemium model for Nagwa Exams, with per-topic analytics behind the subscription, and drove the live-classes

desktop app through a four-phase delivery roadmap.

- Shipped an internal AI-enabled workflow that automated parts of the content creation process.

Outcomes: A consumer line that opened new revenue and later grew into apps like Nagwa Classes, now past 1M+ downloads, and a content team 20% faster.

Squad Leader (Scrum Master), Ibtikar Technologies (Squadio) — Egypt

October 2020 – April 2021

Ibtikar (Squadio) places agile engineering squads inside growing companies. The brief: run delivery for squads serving Saudi clients, including Aanaab, the teacher-development platform, and Monshaat, the Kingdom's SME authority, and make the teams measurably better while doing it. The whole operation was remote, which is the hard part when you are running the daily rhythm of two squads and eighteen engineers across two clients.

- Ran the delivery layer end to end: weekly operations meetings, per-sprint progress and utilization reports to clients, product owners and tech leads, and Gantt-based dependency planning in Tomsplanner to keep delivery against the plan.
- Was the single gate between the squad and everything outside it, holding the line on mid-sprint scope changes so the engineers had a stable space to build in.
- Made remote work through tooling and standards instead of meetings: asynchronous stand-ups through Slack bots and StatusHero gave clients and leads daily visibility without pulling engineers into status calls.
- Coordinated with product owners, tech leads, and DevOps so backlog items, product increments, and deployment requirements meant the same thing to everyone.
- Cut unnecessary meetings and task switching, and initiated refactoring and unit-testing practices to attack rework at its source.

Outcomes: 15+ product increments delivered to Aanaab and Monshaat, team utilization up 15%, rework rates down, and Aanaab is still live today, serving 200,000+ registered teachers across 10+ Arab countries.

Lead Business Analyst / Product Manager, Mawaqaa — Kuwait

August 2019 – October 2020

Mawaqaa (National Web Solutions) is a Kuwaiti digital agency serving government and enterprise clients. The brief: fix how the company sold and delivered, from pre-sale through the full development lifecycle.

- Rebuilt the pre-sale process and the SDLC, introducing agile and a new documentation system (SRS template, design playbook, Definition of Done) that improved progress and delivery across all products.
- Led the pre-sale activities that landed the biggest deals in company history, then led the analysis, design, and engineering teams that delivered them.
- Delivered projects across very different domains and technology stacks, from auto services (Aayan Auto) to healthcare (Dar Al Shifa) to pharmacy e-commerce (Pharmazone).
- Designed loyalty and retention programs for four Kuwaiti retail brands, and quality-gated the analyst team's specs as the named reviewer on every major project.

Outcomes: The largest deals in company history landed and delivered, a documentation and delivery system the teams kept using, and live products across three industries.

Product Manager, TECHOFFICE.co — Kuwait

December 2018 – August 2019

TECHOFFICE is an early-stage Kuwaiti venture builder. The brief was the purest version of the product job: there is no team, no product, and no playbook. Build all three.

- Assembled, mentored, and led the engineering and design teams from zero, owning the backlog, per-developer allocation, and the monthly budget.
- Built 0-to-1 products across e-commerce, wellness, and last-mile delivery.
- Developed each MVP through market research, competitive analysis, and a go-to-market strategy, using whatever technology fit the problem.

Outcomes: Multiple products taken from idea to market, including a drop-shipping platform that landed 60+ clients in its first quarter.

EARLY CAREER HIGHLIGHTS

System Analyst, Diyar United Company

July 2017 – December 2018

Diyar United is one of Kuwait's largest system integrators, trusted with national-scale digital transformation. The brief: lead analysis and engineering on mega projects for the country's highest-profile entities.

- Led the analysis and engineering teams delivering the E-Driver's License issuance system for the Ministry of Interior: a journey of paper, queues, and days turned into minutes at a kiosk.

- Delivered the Public Key Infrastructure for the Ministry of Finance and the Public Authority for Civil Information, the trust layer behind Kuwait Mobile ID, and drove the weapons-licensing transformation for the General Department of Weapons Investigations (eight permit types, a 30,000 smart-card rollout, CMMI ML4) plus the Public Authority for Industry.

Outcomes: National systems that residents of Kuwait still use every day, and a licensing journey cut from days to minutes.

System Analyst, Ministry of Awqaf & Islamic Affairs

January 2016 – March 2017

After two years building the ministry's systems as a developer, I moved to the analysis side. The brief: deliver a full Learning Management System for the ministry's schools, with a remote team.

- Led a remote engineering team through the delivery of the LMS: attendance tracking, scheduling, classroom allocation, transcript generation, and more, coordinating stakeholders through requirements elicitation and across the whole project.

Outcomes: The LMS delivered and adopted by the ministry's schools.

Full-stack Developer, Ministry of Awqaf & Islamic Affairs

March 2014 – January 2016

Where the technical foundation comes from. The brief: help the ministry's departments replace manual routines with software.

- Built workflow and day-to-day operations apps in .NET and Python, using MVC and MVVM with knockout.js and Bootstrap, and took part in the ministry's transformation to Scrum and agile.

Outcomes: Workflow systems that departments ran their daily operations on.

Instructor, Pitman Training

January 2013 – January 2014

Pitman is a global training provider; the Kuwait center needed its technical courses taught and its catalogue refreshed.

- Designed and delivered over 900 hours of technical training to more than 1,000 attendees, and introduced new courses in hybrid programming and front-end development.

Outcomes: 900+ teaching hours, 1,000+ students, and revenue growth from the new course lines.

RECOGNITION & ADVISORY

- ADPLIST Top 50 Mentor in Customer Experience (2026, ongoing mentorship).
- MENA market-intelligence consultant for AlphaSights and Guidepoint (paid expert-network engagements on consumer, commercial, and market strategy across the region).

EDUCATION

MBA in Marketing (in progress) — Arab Academy for Science & Technology (AASST), 2026

GPA to date: 3.56 / 4.0 across 36 credits, alongside a full-time product leadership role.

Management core (completed): Contemporary Management (A), Managerial Economics (A), Applied Statistics (A), Human Resources Management (A), Accounting & Financial Reporting, Managerial Finance, Operations Management.

Marketing major (completed): Marketing Management (A), Consumer Behavior (A), Channels of Distribution Management (A-), International Marketing (B+), Promotion & Personal Selling.

Final stretch: Marketing Research, Advanced Marketing Management, Strategic Management, and MIS & E-Business, followed by the comprehensive exam. Expected completion 2026.

B.Sc. in Computer Science — Arab Academy for Science & Technology (AASST), 2012

LANGUAGES

English, Arabic: Professional proficiency
